

Botulinum Toxin Injection 肉毒桿菌素注射(英文)

To remove the facial lines within a short period of time, non-invasive procedure - Botulinum Toxin Injection may be an ideal approach. Botulinum toxin injection is one simple and safe therapy that must be diagnosed by professional physician for validation of feasibility and determination of the injection area and injection dosage.

Description of Therapy

Botox[®] can block the nerve impulses between nerves and muscles, causing the facial muscles to fully relax. Through the relaxation of the facial muscles, the amount of facial wrinkles will reduce, but will also disappear. Botox[®] only focuses on getting rid of wrinkles and will not affect any surrounding muscles. If dose proper.

Therapy Effectiveness and Success Rate

Botox[®] can improve the main dynamic lines, such as crow's feet, forehead wrinkles, frown lines, the masticatory muscles (masseter hypertrophy commonly known as the country faces the word), gastrocnemius muscle hypertrophy (thin legs), hand sweat, subaxillary sweating, adjustment of eyebrows, and neck lift. (Note: Depending on your medical background, results will vary.)

Therapy Risks

Apart from the skin rash, allergy, and itchiness from the application of analgesia medicine, common contact dermatitis includes the following:

1. Temporary red and swollen skin after therapy, or the skin bruise caused by injection.

2. Botulinum toxin can cause minor temporary facial stiffness, muscular asymmetry between facial expression, drooping eyelid, or eyebrow and muscle weakness.

3. do Not use for patients of myasthenia Gravis, protein allergy, and patients using neurotransmitters.

4. Patients using aspirin or anticoagulants are suggested to discontinue for 3 days before injection to avoid apparent bruise.

(Note : Different body or condition bears different risk and patients are obliged to inform the physician of your complete medical condition).

Durability of Botulinum Toxin

Botulinum toxin causes muscles to experience temporary denervation so the muscles will reduce the contracting intensity. In about 6 months, the previous muscular functions will restore. Hence the therapy effect of botulinum toxin will gradually disappear.
